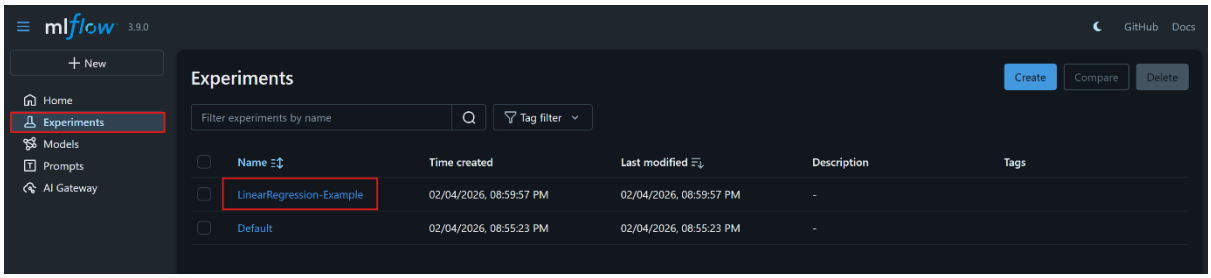
How to register a model in MLflow?

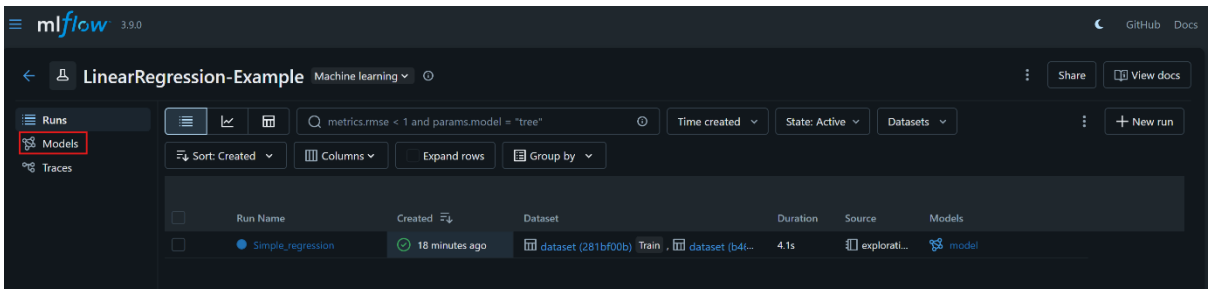
Assuming you have tried different models with different parameters, you might want to register the best model. To do this, you need to be on the MLflow UI (user interface).

Instructions:

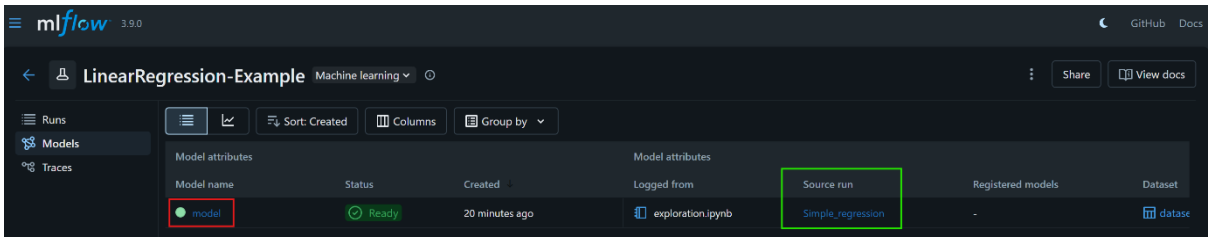
Make sure you are on "Experiments" from the left panel options. Select the name of the experiment you want (e.g. "LinearRegression-Example")



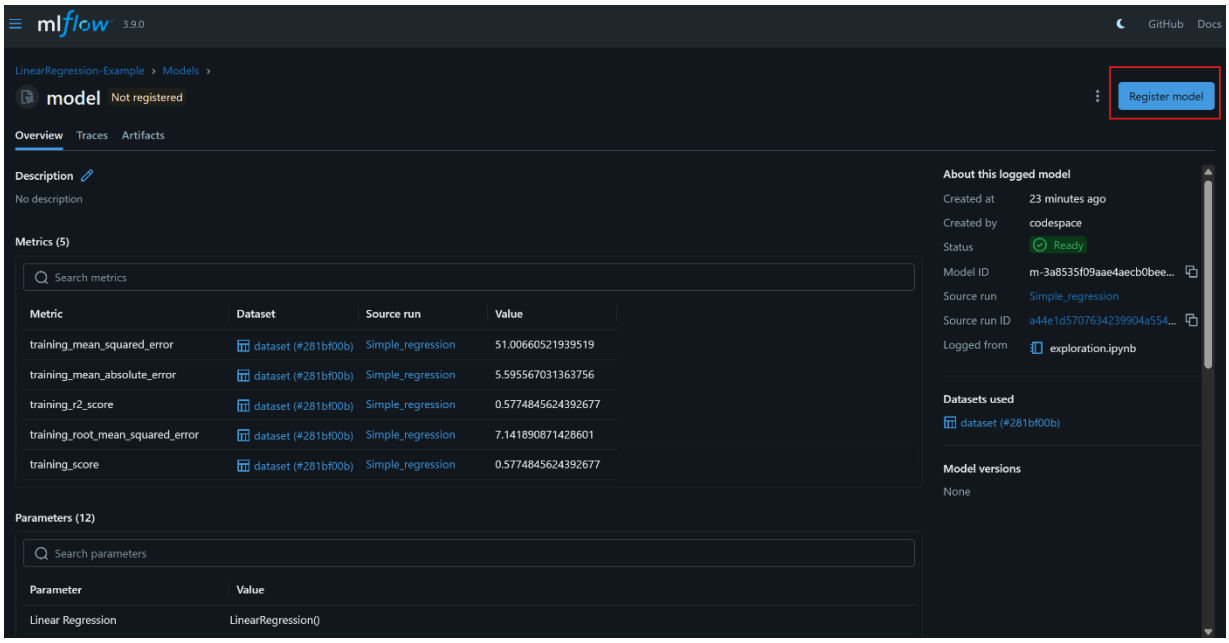
Once you are in the experiment, pick "Models" from the left panel.



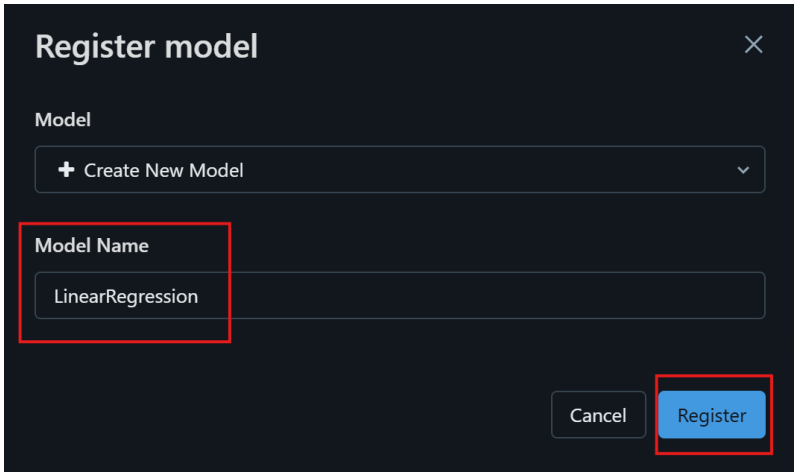
Make sure you know which "Source run" you want to use, and then click "model" (or any other model name you have put).



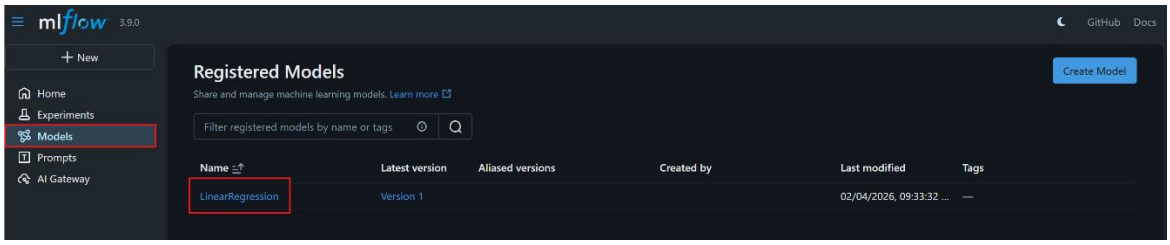
After you have checked "Metrics" and "Parameters" to make sure it's the model you want to register, press "Register model".



First click "Select a model", then click "Create New Model" and finally write a model name (e.g. LinearRegression)



Now if you go back to the homepage, and click "Models" on the left panel, you will see your registered model. Good job, you registered your first model!



Now you should be able to run the example cell in the Assignment 1 notebook:

```
model_name = "LinearRegression"
model_version = 1

model_uri = f"models:/{model_name}/{model_version}"
model = mlflow.pyfunc.load_model(model_uri=model_uri)

X_forecast = future_df[["Speed"]]
predictions = model.predict(X_forecast)

predictions_df = future_df[["Speed"]].copy()
predictions_df["Predicted_Power"] = predictions

print(predictions_df.head())
```

[16] ✓ 0.2s

```
...        Speed  Predicted_Power
0  15.19936        29.307839
1  16.09344        30.872997
2  16.98752        32.438154
3  16.09344        30.872997
4  12.96416        25.394947
```
